

# AWS CLOUD COMPUTING – QUESTIONS & ANSWERS

**1. Sign up for a free AWS or Azure account and log in to the Management Console. Take a screenshot of your dashboard showing your name or email in the top bar.**

**Answer:** I signed up for an AWS account and logged in to the AWS Management Console. After logging in, the AWS Console dashboard was displayed. The account name or email can be seen in the top bar. A screenshot of the dashboard should be attached as proof.

**Steps:**

1. Open the AWS website and create/sign in to an AWS account.
2. Open the AWS Management Console.
3. Go to the Console Home/Dashboard.
4. Check the top bar for the signed-in account information.
5. Take a screenshot of the dashboard.

**2. In the AWS or Azure Management Console, locate and list 5 key services (such as Compute, Storage, Database, Networking, Analytics). For each, write one line describing what it does and name one real app (like Instagram, Zomato, Flipkart) that could use it.**

| Category   | AWS Service   | What it does                                                                | Example App     |
|------------|---------------|-----------------------------------------------------------------------------|-----------------|
| Compute    | Amazon EC2    | Provides virtual servers for running applications and websites.             | Netflix         |
| Storage    | Amazon S3     | Stores files such as images, videos, documents, backups, and other objects. | Instagram       |
| Database   | Amazon RDS    | Provides managed relational databases for storing application data.         | Zomato          |
| Networking | Amazon VPC    | Creates a secure, isolated virtual network for cloud resources.             | Flipkart        |
| Analytics  | Amazon Athena | Analyzes data stored in services such as S3 using SQL queries.              | E-commerce apps |

**3. Use the search bar in your AWS or Azure Console to find the S3 (AWS) or Blob Storage (Azure) service. Write down the steps you took to locate it and describe in 2–3 lines how a music app like Spotify could use this service to store user-uploaded files.**

**Answer – Steps to find Amazon S3:**

1. Log in to the AWS Management Console.
2. Click the Search bar at the top of the console.
3. Type **S3** or **Amazon S3**.

4. Select **Amazon S3** from the service search results.

5. The Amazon S3 console opens, where storage buckets can be created and managed.

**Use by a music app:** A music application like Spotify could use Amazon S3 to store user-uploaded audio files, album artwork, podcasts, and other media files. S3 provides scalable object storage, allowing the application to store and retrieve a large amount of content as it grows.

**4. Pick one key characteristic of cloud computing (on-demand self-service, broad network access, resource pooling, rapid elasticity, or measured service) and explain, in your own words, how it benefits users of a popular app you use daily (e.g., Paytm, BookMyShow, IRCTC). Hint: Think about how these apps handle sudden spikes in users or data.**

**Answer – Rapid Elasticity:** Rapid elasticity means that cloud resources can be increased or decreased quickly according to demand.

**Example – BookMyShow:** When tickets for a popular movie or event become available, a very large number of users may access the app at the same time. Cloud infrastructure can provide additional resources during such traffic spikes and reduce them when demand becomes normal. This helps the application handle changing numbers of users more efficiently.

**In simple words:** Rapid elasticity helps an app handle sudden heavy traffic without needing to keep maximum resources running all the time.
